1. Code Structure

The project follows standard HTML5 structure including DOCTYPE,

<html>, <head>, and <body> tags. The layout is divided into

semantic sections such as header, main content, and footer.

2. Key Sections

The <header> contains the masthead and highlights section.

The main content area is divided using <section> and <article>

tags to represent individual news stories.

The <footer> contains publication details.

3. Design Decisions

A table was used to create column layout because external CSS

was not allowed. Inline styling was applied to control spacing,

alignment, and colors while maintaining readability.

4. Challenges

Recreating a newspaper layout using only HTML was challenging,

especially maintaining column alignment and structure.

Proper indentation and semantic structure were maintained

to ensure clean and understandable code.
